

A3_HW3_CarriereZ Plan

I am required to create a database and then create a webpage to display the content. I must utilise HTML, CSS, SASS, JS, and PHP to accomplish this.

I created my database in the phpMyAdmin web app. From there I filled it with data and found/created images for my site. I then created the html and roughed in the details. I then connected the page to my database with JS and PHP. Once that was done, I assigned the data from the database to the webpages template and proper section. Lastly I used sass to style the page for spacing, layout, colours, and some extra visual interest.
